Motivation
from model
theory

Permutation
groups

Cherlin's
conjecture

Towards a
proof

Definition

A **relational structure** \mathcal{S} is a tuple $(\Omega, R_1, R_2, \dots, R_k)$ where

- Ω is a (finite) set;
- For all $i = 1, \dots, k$, there is an integer ℓ_i such that

$$R_i \subseteq \underbrace{\Omega \times \Omega \times \dots \times \Omega}_{\ell_i}.$$

Automorphisms

On Cherlin's
Conjecture

Nick Gill
(USW)

Motivation
from model
theory

Permutation
groups

Cherlin's
conjecture

Towards a
proof

Definition

An **automorphism** of a relational structure $(\Omega, R_1, \dots, R_k)$ is a permutation $\phi \in \text{Sym}(\Omega)$ such that

$$(\omega_1, \dots, \omega_{\ell_i}) \in R_i \text{ for some } i \implies (\phi(\omega_1), \dots, \phi(\omega_{\ell_i})) \in R_i.$$

Automorphisms

On Cherlin's
Conjecture

Nick Gill
(USW)

Motivation
from model
theory

Permutation
groups

Cherlin's
conjecture

Towards a
proof

Definition

An **automorphism** of a relational structure $(\Omega, R_1, \dots, R_k)$ is a permutation $\phi \in \text{Sym}(\Omega)$ such that

$$(\omega_1, \dots, \omega_{\ell_i}) \in R_i \text{ for some } i \implies (\phi(\omega_1), \dots, \phi(\omega_{\ell_i})) \in R_i.$$

This notion of an automorphism just extends the accepted definition of an automorphism of a (directed) graph.

theory

Permutation
groups

Cherlin's
conjecture

Towards a
proof

“Local symmetry implies global symmetry”.

Definition

A relational structure \mathcal{S} is called **homogeneous** if, given two induced substructures \mathcal{S}_1 and \mathcal{S}_2 and an isomorphism $\psi : \mathcal{S}_1 \rightarrow \mathcal{S}_2$, there is an automorphism $\phi \in \text{Aut}(\mathcal{S})$ such that $\phi|_{\mathcal{S}_1} = \psi$.

Homogeneity

On Cherlin's
Conjecture

Nick Gill
(USW)

Motivation
from model
theory

Permutation
groups

Cherlin's
conjecture

Towards a
proof

“Local symmetry implies global symmetry”.

Definition

A relational structure \mathcal{S} is called **homogeneous** if, given two induced substructures \mathcal{S}_1 and \mathcal{S}_2 and an isomorphism $\psi : \mathcal{S}_1 \rightarrow \mathcal{S}_2$, there is an automorphism $\phi \in \text{Aut}(\mathcal{S})$ such that $\phi|_{\mathcal{S}_1} = \psi$.

In other words, every local symmetry in the relational structure extends to a global symmetry of the overall structure.

Lemma

If the action of G on Ω is 2-transitive and binary, then $G = \text{Sym}(\Omega)$.

Proof.

- 1 Let $\mathcal{S} = (\Omega, R_1, \dots, R_k)$ be a homogeneous structure that is compatible with the action and for which R_1, \dots, R_k are all binary.
- 2 If $(\omega_1, \omega_2) \in R_i$, then $(\omega_1, \omega_2)^g \in R_i$ for all $i = 1, \dots, k$.
- 3 2-transitivity $\implies R_i$ is equal to $\Omega^{(1)}$ or $\Omega^{(2)}$ or Ω^2 .
- 4 We conclude that $G = \text{Aut}(\mathcal{S}) = \text{Sym}(\Omega)$.

- 3 If G is binary and G^Λ acts 2-transitively on Λ , then $G^\Lambda = \text{Sym}(\Lambda)$.

Definition

If $\Lambda \subseteq \Omega$ and G^Λ is 2-transitive but not equal to $\text{Sym}(\Omega)$, then we say that Λ is a **barely 2-transitive** subset of Ω .

Our method is to study the almost simple primitive actions and show that they (nearly) always contain a barely 2-transitive subset.
